1. App Idea: Should create an application for finding the caretaker of elderly people within trusted neighborhood, similar to the application for finding the babysitter within trusted neighborhood. The reason behind this idea is that there are some features in many devices which identify accident and creates alert but sometimes it does malfunction. Also, for making application a new idea stroked me, to make the application so user friendly that the person who is using it on daily basis can't get bored or feel irritated using it.

2. One of the most used methods is In-App purchase, where the creator provides the basic functions of applications to be used free and charges for some additional functionality. Secondly many creators used this method called Freemium, which usually has two versions of their application. One is for free with basic functionality and the other one is paid with all the additional functionalities. Lastly some money transactions applications provide all services for free and also allows you to use the application without any advertisement interference, but they charge you in the form of transaction fees as and when you transfer money.

3. The applications which I use on daily basis and feels that the UI/UX of that application is too good and user friendly are Dunkin, Amazon shopping and Amazon prime music. Firstly, I talk about Dunkin, this application had very beautifully divided tabs for Iced drinks, Hot drinks, Sandwiches & wraps, etc. which makes it user-friendly regardless of the age group of people using it. Also, it has direct tabs for daily offers, payment and order to make it very easy to use.

   Secondly let's go with Amazon shopping, as soon as you open the application it gives you tabs whether you are looking for groceries, pharmacy, deals of the day and many more. Being able to navigate easily through the application to buy whatever I want within some moment, makes it more attractive.

   Now let's talk about Amazon prime music, as soon as you open the application it gives you the tab to surf for music, go to the library which had many tabs including the one with the playlist of songs you play often. Then comes the home tab which guides you to the some of the recently heard music. All this tab makes it quite easy to use i.e., user-friendly.

4. Yes, the discussion in class has got me closer towards the application I want to build, that is to create an application for helping the elder peoples to search for caretaker in their trusted neighborhood. Apart from this I also found one more interesting application to work on, i.e., the application which helps in detection of the fake news based on the facts and some valid news. Which on the other hand will help people to understand the situation properly and to stop unnecessary chaos in the world.
